

Slide Bearings Type WG For Highest Thrust Loads

Slide Bearing Type WG

RENK series WG have been specially designed to carry highest thrust loads. The main application fields for this type of bearing are large electric machines and rolling mill drives. The use of the WG series prevents damage in cases where shock loads or highest thrust loads at low speed occur.

Side bearings type WG are based on RENK's long experience in the manufacture and design of slide bearings. The WG bearings can integrate different bearing components of various series, such as for instance, the shells of the SC type, the seals of the E type and the RD pads of the thrust bearing. The modular system reduces the stockkeeping of spare parts. Quite often it is possible to equip locating and non-locating bearings with the same journal parts or seals. Worn parts can be easily delivered from stock at short term.

Technical Information

Bearing Housing

The WG bearings have fabricated housings, of extremely rigid design, capable of taking highest thrust shock loads. They are most suitable to protect expensive installation parts against thrust loads in case of damage. Besides, the fabricated housings offer a most cost-effective solution.

RENK's own EDP-department offers order-related calculations of the stiffness and deflection of the bearing housing.

Journal Bearing

The shells are part of the SC type of modular compound principle. The shells are designed in accordance with the latest technical development. Contact RENK for reference information.

The shells have a spherical seating in the housing. This makes assembly easy and ensures a good heat transfer between bearing shell and housing. Upon request, the journal bearing can be provided with hydrostatic jacking.

Thrust Bearing

The RD-pads can carry high axial loads at low speed. A corresponding design ensures enough oil film thickness even under most unfavourable operating conditions.

The cup spring supported pads have excellent damping properties, absorbing shocks elastically.

Due to the modular component principle it is possible to adapt the thrust parts of the bearing to any technical requirement a customer might have.

Seals

WG bearings can be provided with the same type of seals as used for the E series.

All sealing systems are available in all corresponding sizes. However, the WG bearings are mainly provided with adjustable rigid labyrinth seals. The first two labyrinths prevent the lateral escape of the lubricant. Small oil quantities which have not been wiped off by the first group of labyrinths are collected into a chamber situated between the two groups of labyrinths.

Through the return bores the lubricant flows back into the oil sump. Five other labyrinths build up the actual seal, that is, they prevent oil leakage and the penetration of impurities into the bearing.

Oil Supply

WG bearings can be designed to suit perfectly most different operating conditions.

Two fixed oil rings ensure emergency lubrication. Oil grooves and an oil scraper deliver the lubricant to the running surfaces. Various design forms make a safe lubrication of the thrust bearing possible. This ensures safe operation at any time.

Bearing Calculation

Based on the operating conditions indicated by the customer RENK can carry out hydrodynamic and thermic calculations for every bearing to be supplied. The values necessary for the calculations, such as speed, load, lubricant viscosity, ambient temperature offer the decisive base for bearing performance.

The operational safety of a bearing depends mainly on the bearing temperature and on the oil film thickness.

Upon request, our EDP-calculation department checks the stiffness and deflection of the bearing housing with the help of the Finite Element Method (FEM).
